

DATA STORAGE METHOD

ABSTRACT

A data storage method is provided, which is applicable to a computer device having a
5 RTC (real-time clock) unit and a memory card access unit. The method includes the steps of:
(1) accessing the RTC unit for obtaining a time value of a particular date when the computer
device receives a data storage request from the memory card access unit; (2) determining if a
memory unit of the computer device performs data storage operation on the particular date; if
no, setting an identification value to be 1 and going to step (4); if yes, obtaining an
10 identification value of the latest processed folder of the particular date and going to step (3);
(3) adding 1 to the identification value; and (4) using the time value obtained from the RTC
unit and the identification value from step (2) as a folder name for data from the memory
card access unit.
